Premesso che l'ARNAS Civico ha partecipato per il tramite della Regione Siciliana – Assessorato della Salute al Bando della Ricerca Finalizzata 2018 (anni finanziari 2016-2017) con il Programma di rete in oggetto indicato coordinato dalla Regione Lombardia, con la partecipazione delle Regioni Emilia Romagna e Liguria.

Con la nota prot. n. 3317 del 26 luglio 2019, che si allega, il Ministero della Salute ha comunicato che è stata approvata la graduatoria e che il predetto Programma si è utilmente collocato nell'area di finanziamento ministeriale per complessivi € 1.200.000,00, da erogare agli Enti del SSN partecipanti, cui si aggiungono i cofinanziamenti regionali pari a € 300.000,00 per ciascuna Regione.

Lo stesso Ministero ha richiesto, per la sottoscrizione della convenzione nazionale, l'acquisizione di diversi documenti tra cui, per ogni Work Package (WP), la convenzione relativa al cofinanziamento regionale, che dovrà essere sottoscritta digitalmente da ogni singola Regione cofinanziatrice e dall'Ente nel cui ambito sono svolte le attività di ricerca del WP di competenza.

Tutta la documentazione dovrà pervenire al Ministero della Salute, attraverso la Regione capofila Lombardia entro il 26 novembre 2019.

Detto quanto sopra, nell'invitare il Responsabile Scientifico del WP 4 Prof. Salvatore Corrao a prendere visione della nota ministeriale e della documentazione richiesta, sarà cura dello scrivente Dipartimento sottoporre successivamente alle SS. LL. la convenzione regionale per la sottoscrizione, nonché comunicare ogni altra disposizione per il completamento della procedura amministrativa.

Overall Summary

The management of elderly patients with chronic diseases represents an important public health need of our times with consequent increasing costs and reducing sustainability of our NHS. According to the 2013 United Nations report, people in developed countries are ageing; increasingly patients develop chronic disease progression with serious complication up to the irreversibility and referral to PC. In this scenario, the early identification of terminally ill patient might contribute to the development of clinical strategies to avoid overuse of medical care and to help patients with terminal illness to achieve the best quality of life and care, nearing the end-of-life. Evaluation of multidimensional approach of a patient with chronic disease by a multiprofessional team, is expected to lead to more appropriate "end-of-life" decisions.

Background / State of Art

With ageing of the population, there is an increase risk of death due to chronic diseases, such as cancer and heart failure (1). According to WHO and Cancer Research UK, in 2008 cancer was estimated to account for 7.6 million deaths (12% of all deaths) worldwide (2). Therefore, palliative care has been identified as one of the worldwide public health priorities (3). Palliative care interventions are focused with "the quality-of-life of patients and families who face life-threatening illness, by providing pain and symptom relief, spiritual and psycho-social support from diagnosis to the end-of-life and bereavement" (4). Obstacles to quality end-of-life care have also been identified and may include failure to recognise treatment futility, lack of communication among decision makers, disagreement on the course of end-of-life care, and failure to implement a

Project Type: WP PROJECT - 4	

timely end-of-life plan of care.

In many clinical areas, integrated care pathways are utilised as structured multidisciplinary care plans (5). In particular, care pathways for the dying have been developed as a model to improve care of patients who are in the last days of life. The care pathways were designed with the aim of ensuring that the most appropriate management occurs at the most appropriate time, and that it is provided by the most appropriate health professional. According to Chan's systematic review (6) evidence supporting end-of-life care pathways is lacking but the principles underpinning such pathways are relevant and plans for end-of-life care should be developed in open consultation with the patient and significant others.

There is then a clinical need to evaluate advanced and terminally ill patients through a multiprofessional and multidimensional assessment to identify those to be admitted to palliative care pathways in order to improve patient and families' quality of life and reduce the number of unnecessary overtreatments (7). This multidimensional assessment model was successfully used at the Internal Medicine Outpatient Clinic at the ARNAS Civico Hospital in Palermo in 2016 to assess elderly affected by chronic diseases (8).

Hyphotesis and Specific AIMS

Hyphotesis and Significance:

This study aims to evaluate complex patients hospitalised in internal medicine and geriatric wards through a multidimensional and multiprofessional assessment for the early identification of terminal conditions allowing physicians to send patients to the hospice or the palliative home care service.

Preliminary Data:

In 2008 the research team participated in a study (9) aimed to recognize, among hospitalized elderly, clusters of diseases (i.e., two or more co-occurrent diseases) and to identify accordingly groups of patients at risk of in-hospital death and adverse clinical events. This cross-sectional study was conducted in Italy in 38 internal medicine and geriatric wards participating in the Registro Politerapie SIMI (REPOSI). The study enrolled 1,332 inpatients aged 65 years or older: 86.7% of the patients were discharged, 8.3% were transferred to other hospital units, 5.0% died during hospitalization and 36.4% of the patients had at least one adverse clinical event. Patients affected by the clusters (which included heart failure (HF) and either chronic renal failure (CRF) or chronic obstructive pulmonary disease) had a significant association with in-hospital death (OR, 4.3; 95% confidence interval [CI], 1.6-11.5; OR, 2.9; 95% CI, 1.1-8.3, respectively), as well as patients affected by CRF and anemia (OR, 6.1; 95% CI, 2.3-16.2). The cluster including HF and CRF was also associated with adverse clinical events (OR, 3.5; 95% CI, 1.5-7.8). The effect of both HF and CRF and anemia and CRF on in-hospital death was additive. Authors' conclusion was that several groups of older patients at risk of in-hospital death and adverse clinical events were identified according to disease clustering. Knowledge of the relationship among co-occurring diseases may help developing strategies to improve clinical practice and preventative interventions.

In a recent study by Corrao S., et al (10) on predictors of mortality in older patients with co-morbidities hospitalized in internal medicine and geriatric wards, the authors retrospectively analyzed the data collected from the REPOSI project. Socio-demographic, laboratory and clinical characteristics of subjects with pneumonia were investigated and a multivariate logistic analysis was used to explore the relationship between variables and mortality. Among 4714 patients 284 had pneumonia, 52.8% were males and the mean age was 80 years old. 19.8% of these patients had a Barthel Index ≤ 40 ($p < 0.0001$), as well as 43.2% had a short blessed test ≥ 10 ($p < 0.0117$). In these subjects a significant Cumulative Illness Rating Scale (CIRS) for the evaluation of severity and co-morbidity indexes ($p < 0.0001$) were present. Although a higher fasting glucose level was identified in people with pneumonia, in the multivariate logistic analysis diabetes was not independently associated with in-hospital, 3-month and 1-year mortality, whereas patients with lower Barthel Index had a

Project Title:

Early identification of end-of-life care needs and prognostication in complex patients hospitalized in internal medicine and geriatric wards.

Project Code: NET-2018-12367032-4

Principal Investigator: Corrao Salvatore

Research Type: b) Change-promoting: valutare la sicurezza, efficacia, costo-efficacia, di trattamenti/tecnologie/interventi sanitari per cui sussistano significativi margini di incertezza relativamente agli aspetti menzionati, anche con studi clinici di fase 3 e 4

Applicant Institution: Sicilia

Project Type: WP PROJECT - 4

higher mortality risk (odds ratio being 9.45, 6.84, 19.55 in hospital, at 3 and 12 months). The authors' conclusion was that elderly hospitalised patients affected by pneumonia with a clinically significant disability had a higher mortality risk while diabetes does not represent an important determinant of short and long-term outcome.

In this scenario, the multidimensional assessment has been successfully used to assess elderly in the Internal Medicine Department of the National Relevance and High Specialisation Hospital Trust (ARNAS) Civico, Di Cristina, Benefratelli of Palermo and allowed a timely identification of clinical conditions relevant to prognosis estimation through screening tests done by different healthcare specialists like an internist, a nurse, a nutritionist and a podiatrist. For the purpose of this project, the Multidimensional Assessment will be redesigned according to palliative care approach and terminal patients' needs and will include a case-manager, psychologists, physiotherapists and clinical pharmacologists in order to better investigate patients' conditions.

Specific Aim 1:

To identify criteria and tools to evaluate palliative care needs and assess prognostic factors by developing a multidimensional assessment for internal medicine patients, for the early identification of patients suitable for transfer to hospice or the palliative home care service.

Specific Aim 2:

To develop assessment procedures to modify clinical practices and prescribing attitudes in the internal medicine ward, in order to avoid possible therapeutic obstinacy and overtreatment.

Specific Aim 3:

Implementation of early identification of end-of-life patients in the internal medicine setting.

Experimental Design Aim 1:

Criteria and tools used for multidimensional assessment of complex patient with multimorbidities, including symptoms burden and prognostic criteria, will be identified in accordance with existing scientific literature. The tools identified will be adapted if needed. The appropriateness of the criteria chosen will be evaluated in a focus group carried out with multiprofessional health care providers with extensive experience in the management chronic patients and in palliative care.

Experimental Design Aim 2:

A longitudinal observation study on palliative care needs and prognostic factors, using validated international instruments (such as the NECPAL and the and the Edmonton Symptom Assessment Scale) will be conducted including all the consecutively admitted patients for 12 months at the internal medicine department of the National Relevance and High Specialization Hospital Trust (ARNAS) Civico, Di Cristina, Benfratelli of Palermo, to investigate patients conditions and to early identify their palliative care needs.

Experimental Design Aim 3:

A longitudinal study will aim at validating the predictive model developed in the first phase of WP4 (see Experimental Design Aim 2) and at documenting quality of life, symptom control and clinical and prescribing changes for the patients who will die in the ward and for the patient referred to hospice and palliative care at multidisciplinary multiprofessional evaluation and description of the referral process. Family satisfaction with care will be assessed with the FAMCARE questionnaire (11).

Early identification of end-of-life care needs and prognostication in complex patients hospitalized in internal medicine and geriatric wards.

Project Code: NET-2018-12367032-4

Principal Investigator: Corrao Salvatore

Research Type: b) Change-promoting: valutare la sicurezza, efficacia, costo-efficacia, di trattamenti/tecnologie/interventi sanitari per cui sussistano significativi margini di incertezza relativamente agli aspetti menzionati, anche con studi clinici di fase 3 e 4

Applicant Institution: Sicilia

Project Type: WP PROJECT - 4

Picture to support preliminary data:

Preliminary Data.pdf

Methodologies and statistical analyses:

The estimated sample size is of 1000 complex patients admitted to the internal medicine ward from emergency room, based on the foreseen number of admission during an 12 months period. The number of patients who will die in the ward or who will be transferred to palliative care services during the study period can be estimated as equal to the 5% (± 2) of these patients. Data will be reported as percentages for categorical variables and as means (95% confidence intervals) for quantitative variables. Stata (Stata Corp. 2016. Stata Statistical Software: Release 14.1. College Station, TX: Stata Corp LP) will be used for database management and analysis.

Expected outcomes:

1. To share the end-of-life care decisions with the patient, the caregivers and all the specialists involved in the care of patients admitted to internal medicine and geriatric wards.
2. To reduce healthcare service costs through the early identification of terminal patients that can limit the number of unnecessary exams and their costs.
3. The development of a management model and improved clinical pathway for the early identification of terminal internal medicine inpatient and referral to palliative care. This new model could be exported, shared and implemented in other healthcare settings.
4. Realisation of training and learning paths and development of ad hoc reporting system for multidimensional and prognostic assessment and referral procedures to palliative care.

Risk analysis, possible problems and solutions:

It could be difficult to identify a large number of patients to admit to the hospice or to the palliative care home services because the study will start as a single centre one. We expect to create an hospital regional network to enroll a larger number of patients to assess.

Significance and Innovation

This project aims to improve and create a new way to assess non-oncological and oncological inpatient. Up to date no evaluation score is used to detect terminal conditions and the hospital medical specialist decides alone on patients' goals of care and clinical care pathway. Thank to this new approach terminally ill patients' needs can be detected according to different points of views given by different specialists including palliative care. This is important to allow a better vision of the whole patients' needs and to improve quality of care and patients' and their caregivers' quality of life.

Description of the complementary and synergy research team

The strength of this project is the synergy of a multiprofessional team who will assess patients, in particular, there will be:

- n.5 Physicians: to assess patient's clinical condition;
- n.1 Nutritionist (dietist see agreement 10 July 2014) to assess frailty conditions and to ensure adequate nutritional support, preventing malnutrition and/or dehydration, and according to patient's condition choose alternative ways for nutrition and hydration;
- n.1 Clinical pharmacologist to evaluate the therapeutic appropriateness and the drafting of any deprescribing protocols;
- n.2 Nurses who will be responsible for assessing patients and to early identify their palliative care needs, assessing vital functions and ensuring therapeutic support, planning and implementing personalised assistance to improve quality of life;
- n.1 Physiotherapist to evaluate patient autonomy and their needs to continue exercise, manual therapy, education and advice and to help patients to manage pain to remain independent for as long as possible;
- n.1 Psychologist to evaluate and to manage psychosocial well-being, cognitive state, mood of the patients and / or the caregiver;
- n.1 Case-manager to take care of the patient and his caregiver during the hospital evaluation;
- n.1 Statistical Data Manager to collect and process data related to socio-demographic, clinical-laboratory characteristics and prognostic factors in order to determine possible outcomes.

Training and tutorial activities

Researchers involved in the the work-package will attend scientific courses about palliative care and multidimensional assessment protocol to improve their knowledge and will write scientific papers to disseminate results. This project aims to educate other hospital professionals to use the multidimensional assessment with the possibility to introduce this new evaluation in clinical practice of different healthcare setting. In order to reduce healthcare costs it will be possible to organise conferences about the topic to discuss with other healthcare professionals.

Timeline / Deliverables / Payable Milestones

See Gantt Chart attached.

Milestones 18 month

In the first phase of the project researchers will revise existing literature to identify the most appropriate tools for multidimensional assessment; writing and submitting the research protocol to Ethical Committee. A prognostic score will be developed to modify prescribing attitudes to avoid therapeutic obstinacy, in recruited patients. All the participants will attend training courses to improve the quality of terminal patients care. Report with preliminary data will be written and shared.

Milestones 36 month

In the second phase of the project, implementation of early identification of end-of-life patients in the internal medicine setting will be assessed. In the last part of the project the data manager will analyse data and researchers will write scientific papers and will share results at national and international conferences.

Equipment and resources available

The study will be conducted in an internal medicine ward at the National Relevance and High Specialisation Hospital Trust (ARNAS) Civico, Di Cristina, Benfratelli of Palermo. At the ward we have the possibility to investigate about patients conditions using the available resources by the hospital and the palliative care services.

Translational relevance and impact for the National Health System (SSN)

The early identification of terminally ill patient through this new approach might contribute to development of clinical strategies to avoid overuse of medical care and to help patients with terminal illness to achieve the best quality of life and care, nearing the end-of-life. Evaluation of multidimensional approach of a patient with chronic diseases (or non oncologic diseases) by a multiprofessional team, might lead to more appropriate "end-of-life" decisions, reducing access at the emergency department and other acute care facilities, avoiding unnecessary diagnostic and therapeutic exams.

Personal Statement

Patients with chronic multiple diseases admitted to the internal medicine ward develop progression of their chronic illness, with serious complication up to the irreversibility and the palliative care recognition. The early identification of terminally ill patient might contribute to improve clinical strategies to avoid overuse of medical care and to achieve the best possible quality of care. Professor Salvatore Corrao has a great experience in the management of patients with multiple chronic diseases, as documented through more than 150 publications on international scientific journals, drafting of books, such as, by his experience in clinical practice. As Principal Investigator of Sicilian work package, he will coordinate and supervise all clinical and scientific activities.
